Utilities

Find below a list of all available utilities in alphabetical order:

Utility	Description
E2E Process Dashboard	The Process Dashboard is the interface where you can inspect the details of a BPMN process, that have been collected by the Data Collector services. The collected data is presented in table form or in chart form.
E2E Restifier for SAP	The RESTifier for SAP is a Node.js service that enables you to access any BAPI RFC function of your SAP system from within any application by using REST calls.
E2E Service Dashboard	The Service Dashboard is the interface where you can inspect the more technical details of a service, that have been collected by the Data Collector services. The collected data is presented in table form or in chart form.
WSDL Generator for SAP RFC	The WSDL Generator for SAP RFC service creates WSDL-Files from SAP RFCs in order to import them into a Builder project. The service provides a user interface (UI) to trigger the generation. With this UI you can either request a list of RFCs by putting them into the corresponding field in the UI, or you can specify a simple file as input containing a list of all RFCs. Using a file might be handy in case you have to recreate the WSDL at a later date.
