- [Creating an Error Definition](#)

Related Pages:

The error definition opens in a pop-up window.

The two upper boxes contain information on the error:

- Error Definition:** Contains meta information about the error such as the service that raised the error, error category, code and type.
- Information About Error:** Contains description message that came with the first occurrence, provides a field for remarks, and the current entry state of the error. Every error definition is created in state "New". It is considered good practice to change the entry state to "Checked" when you configured the definition to your needs.

- **Jira:**
Activate if you need custom notifications for errors, for example the creation of Jira tickets.
- **Always notify:**
Activate the option to send the notification each time the error threshold is reached. If the option is not activated, the notification is sent once a day only.

	<ul style="list-style-type: none"> • Error threshold: The threshold defines, how many times the errors may occur until a notification is sent. If Always notify is activated, the notification is sent at every number of occurrences defined in the threshold.
Recipients TO	Enter the email addresses of the notification recipients in this field. Separate multiple addresses with semicolons.
Recipients CC	If required, you can define additional email recipients in this field. Recipients CC is an optional field.
Description for required action	Enter meaningful text that explains to the recipients of the notification what to do if this error occurs.

Subject In this field you can enter a subject for the email notification.

Creating an Error Definition

In most cases, DevOps will wait until a new error appears in the list of service errors and then change its error definition. However, it is also possible to create a new error definition if an error has not yet occurred.

<div> <div> <div>Delete Selection</div> <div>New Error Definition</div> </div> <div>Search: <input type="text"/></div> <div> <div>First Occ</div> <div>Last Occ</div> <div>Error Count</div> <div>Threshold</div> <div>Options</div> </div> <div> <div>05.08.2021 14:37:13</div> <div>06.08.2021 08:34:28</div> <div>3</div> <div>1</div> <div>Downtime</div> </div> <div> <div>05.08.2021 14:37:13</div> <div>06.08.2021 08:34:28</div> <div>3</div> <div>1</div> <div>Downtime</div> </div> </div>	<p>In some use cases, it is useful to create a new error definition from scratch, e.g.</p>
--	--

- to create a new **Template** in case you accidentally deleted the existing one.
- to create a **Match Template** that matches specific parts of the error signature, e. g. the service's name only.
- to create an error definition for an error that has not yet occurred but is already known to the service modeler.

In the navigation bar of the xUML service monitor you can find the button **New Error Definition** for this purpose.

The error definition opens in a pop-up window.

Unlike the error definition of an already existing error, the pop-up is now empty and can be filled according to your wishes.

The fields for **Service Name**, **Error Category**, **Error Code** and **Error Type** each contain an asterisk (*) that serves as a placeholder for all possible contents.

- For the master template (entry state "Template"), in case you accidentally deleted it, leave all definition fields as asterisk (*).
- For a matching template (entry state "Match Template"), define the parts of the error that you want to match, and leave the rest as asterisk. E.g. if you want to create a matching template for a servi

only.

- For an error definition (entry state "New" or "Checked"), fill out all four fields according to the error signature (ask the modeler what to enter here).
