Downtimes and Change Log

Downtimes

Downtimes are defined periods of time during which errors should not trigger notifications. For example: If an SAP system is being updated and will temporarily be unavailable, some services may throw corresponding errors. Since this is known in advance, a downtime for these errors can be configured to avoid the flood of error notifications.

Configuring Downtimes

You can set downtimes for single errors or for whole error groups (see page Managing Error Groups for details).
