

Library Wizard

Bridge repositories compiled from an UML model are called xUML service libraries. Compiling these libraries leads then to importable library repositories (extension: **.Irep**). These xUML service libraries are artifacts devised to design reusable components. For the use of an xUML service library only the library repository is required. This repository can be imported into an UML model like any other supported meta-data (see [Importing xUML Service Libraries](#)). For more information on the concept of xUML service Libraries refer to the [Reference Guide](#).

The Builder provides the **xUML Service Library Wizard**, which supports you with drawing the component diagram of the library, e.g.

Figure: Component Diagram of the SQL Query Library

Example File (Builder project Advanced Modeling/E2ELibrary):

```
<your example path>\Advanced Modeling\E2ELibrary\uml\librarySQLQuery.xml
<your example path>\Advanced Modeling\E2ELibrary\uml\libraryUseLibrarySQLQuery.xml
```
