

# Utilities

Find below a list of all available utilities in alphabetical order:

Utility	Description
<a href="#">E2E Process Dashboard</a>	The Process Dashboard is the interface where you can inspect the details of a BPMN process, that have been collected by the Data Collector services. The collected data is presented in table form or in chart form.
<a href="#">E2E Restifier for SAP</a>	The RESTifier for SAP is a Node.js service that enables you to access any BAPI RFC function of your SAP system from within any application by using REST calls.
<a href="#">E2E Service Dashboard</a>	The Service Dashboard is the interface where you can inspect the more technical details of a service, that have been collected by the Data Collector services. The collected data is presented in table form or in chart form.
<a href="#">WSDL Generator for SAP RFC</a>	The WSDL Generator for SAP RFC service creates WSDL-Files from SAP RFCs in order to import them into a Builder project. The service provides a user interface (UI) to trigger the generation. With this UI you can either request a list of RFCs by putting them into the corresponding field in the UI, or you can specify a simple file as input containing a list of all RFCs. Using a file might be handy in case you have to recreate the WSDL at a later date.
