

Node.js Service Configuration

Using this module to access your configuration values you can edit your configuration inside the E2E Bridge (see [Node.js Service Settings](#)). At each deployment for development, testing or production you can change the configuration to match the environment and your needs. Technically it is a wrapper to [nconf](#).

To use **e2e-conf** in your current project and add it as dependency to your package.json run:

```
npm install --save e2e-conf
```

You can find more a more detailed documentation of the package on the [GitHub](#) or [NPM](#) pages.
