General Connection Error

If the Trace Analyzer can not connect to the **Bridge** the xUML service has been deployed to, you will get the error message "**Service Temporarily Unavailable**" or "**Connection refused: connect**".

There are two possible reasons for this:

- The service location is not correct.
- The service location is correct, but the service is not running.

Solution: Check the Service Location

1. In the test case properties, check the service location.
2. Run the test case again.

Solution: Check whether the Service is Running

1. Make sure that the xUML service is running on the specified **Bridge**. If not, start the service via the **Bridge**. If the service is running on localhost, you can also start the service in the embedded xUML Runtime.
2. Run the test case again.
