

BPMN Error Handling

When modeling business processes, modelers tend to describe the best-case scenario - the way the process should proceed. Nevertheless, there may be

- error procedures (compensations) coming from the process itself, or ...
- technical errors during process execution.

On technical errors, the process state machine will change into an **Error** state. How to handle technical errors within the **Error** state is described in section [Default Error Handling](#).

How to implement **Task Compensations** in the process model is described in section [Task Compensation](#).
