text

If you want to use white spaces like tabs, new lines, or carriage returns in a string, use the text() macro.

Syntax	`aWhitespaceString = text(LITERAL);`	
Semantics	Transforms all escaped white spaces found in a string literal to a real white space. The text macro takes only string literals as parameter. Returns a new string. Only the following white spaces are supported: • \n new line • \r carriage return • \t tab	
Substitutables	`LITERAL`	String literal.
Examples	The literal contains the escaped white space **\n**, which is transformed to a real line break. `set whitespaceString = text("First line.\nSecond line.");`
