

parseLocalDateTimeExpression

Syntax	<pre>set aDateTime = aString.parseLocalDateTimeExpression(aFormat);</pre>	
Semantics	parseLocalDateTimeExpression() initializes a DateTime object from a string using the given format expression. The format expression is a string with placeholders for date/time variables (see Date and Time Formatting). The time zone is always the local one. If the string does not match with the given format, an exception will be thrown.	
Substitutables	aDateTime	Can be any variable or object attribute having the type DateTime .
	aFormat	Can be any variable or object attribute having the type String . The formatting rules can be found in Date and Time Formatting .
	aString	Can be any variable or object attribute having the type String .
Examples	<pre>set aDateTime = aString.parseLocalDateTimeExpression("%D %H");</pre>
