

getServiceContext

Syntax	anArray = getServiceContext(protocol)	
Semantics	<p>Returns an array of ContextElement (Base Components::Basic Behavior::ServiceContext) objects containing all basic context parameters of the specified protocol related to the current request. If the protocol is not known the operation will return an empty array.</p> <p>Certain context parameters accessible with the function <code>getServiceContextValue()</code> are excluded for performance considerations. These are body for HTTP, and header and body for SOAP.</p>	
Substitutables	protocol	A String specifying the protocol, of which parameters are requested.
Examples	<pre>set serviceContext = getServiceContext("tcpip"); set param1.name = serviceContext[0].name; set param2.value = serviceContext[0].value;</pre>	

Supported protocols per service type

Only supported service types are listed.

Service Type	Protocols
HTTP	TCPIP, HTTP
SOAP	TCPIP, HTTP, SOAP
