

Logical Operators

The following logical operators can be used when defining conditions, for instance at decision points or in boolean expressions:

- like
- <
- <=
- >
- >=
- =
- <>
- !=

<> and != can be used equivalently.

Example File (Builder project E2E Action Language/BaseTypes):

<your example path>\E2E Action Language\BaseTypes\uml\boolean.xml

In order to negate a boolean value or expression, use the boolean not() function, for instance not(a and b). Refer also to [not\(\) Operation of Boolean Expressions](#).

Examples

```
set aBoolean = 2 < 1;  
set s = condition (i1 != i2, "abc", "xyz");
```
