

## convertToString DateTime

|                       |                                                                                                                                |                                                                           |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Syntax</b>         | <pre>set aString = aDateTime.convertToString();</pre>                                                                          |                                                                           |
| <b>Semantics</b>      | convertToString() returns the internal lexical representation of DateTime ("CCYY-MM-DDThh:mm:ss[.sss][Z + -]hh:mm") as String. |                                                                           |
| <b>Substitutables</b> | aDateTime                                                                                                                      | Can be any variable or object attribute having the type <b>DateTime</b> . |
| <b>Examples</b>       | <pre>set aDateTimeString = aDateTime.convertToString();</pre>                                                                  |                                                                           |
