

Integer Operations

The W3C defines integers as "decimal", which represents arbitrary precision decimal numbers.

The **Integer** class offers a set of operations:

- [absolute\(\) Operation for Integer Values](#)
- [convertTimeTicksToDateTime\(\) Operation](#)
- [convertToFloat\(\) Operation for Integer Values](#)
- [convertToString\(\) Operation for Integer Values](#)
- [modulo\(\) Operation](#)
- [power\(\) Operation for Integer Values](#)
- [printIntegerExpression\(\) Operation](#)
- [random\(\) Operation returning an Integer Value](#)
