# Exporting Settings

By clicking **Export as CSV** you can export the xUML service settings in CSV format that is compatible with Microsoft Excel. The Bridge generates a file **setting-<service name>-<date>.csv** and opens a download window to let you open or save the file.
This is useful for documentation purposes or if you want to compare settings between two services (e.g. test and production).

Sensitive data like e.g. passwords are not exported, means the exported values are empty.

The CSV file contains the following columns:

* Category
* Key
* Value

The columns are separated by a semicolon.
