Managing xUML Services

The management of xUML Services includes:

* Starting, stopping, and deleting of xUML services
* Editing service preferences
* Installing and managing licenses
* Deploying and managing resources
* Deploying and managing Java packages
* Deploying and managing XSLT scripts
* Defining setting variables

First, you need to select the node instance, on which the xUML services are running. If the appropriate node instance is not yet selected in the **Node Instances** section of the navigation, click it to open its sub-navigation. Then, click the sub-navigation item **xUML Services**.

The information/working area provides the tabs **xUML Services**, **Ports**, **Preferences**, **Licensing**, **Resource**, **Java**, **XSLT** and **Setting Variables**. Tab **xUML Services** is displayed initially.
