

# Deployment Macros

You can use the deployment macros to access service details from within the service implementation.

- [getCompositeCategory\(\) Macro](#)
- [getCompositeName\(\) Macro](#)
- [getCompositeVersion\(\) Macro](#)

Deployment macros are expanded to their actual values during compilation. This means that return values of macros are not objects of a basic type but constants. In action script, you need to use them as a constant, for instance `concat("Service Category: ", getURLFromAlias())` works, whereas `getURLFromAlias().concat(" is the service category.")` does not.

Deployment macros only retrieve the values specified in the service details. **Settings, that have been changed on the deployed service will not be taken into consideration.**
