

# capture

Syntax	<pre>set aStringArray = aString.capture(aRegexPattern)</pre>	
Semantics	Returns a list of all captured groups that are identified by the regular expression.	
Substitutables	aString	Can be any variable or object attribute having the type <b>String</b> .
	aRegexPattern	A variable or a literal containing a valid regular expression defining groups within aString.
	aStringArray	An array of <b>String</b> containing the found groups.
Examples	<p>Assume we have an URL that we want to break down to its elements:</p> <pre>set aMailAddress = "info@acme-corp.com"; set elements = aMailAddress.capture("(.*)(.*)\"";</pre> <p>This will result in an array <b>elements</b> having the array elements <b>["info", "acme-corp", "com"]</b>.</p>
