Creating Shared Designer Namespaces

A common use case in the Designer is that multiple users want to work in a shared namespace. Namespaces are created and assigned in the **Scheer PAS** *User Management*. If you want to create a (shared) namespace, you must have permission for the user management: Only users with profile **user_management_admin** are able to work in the user management.

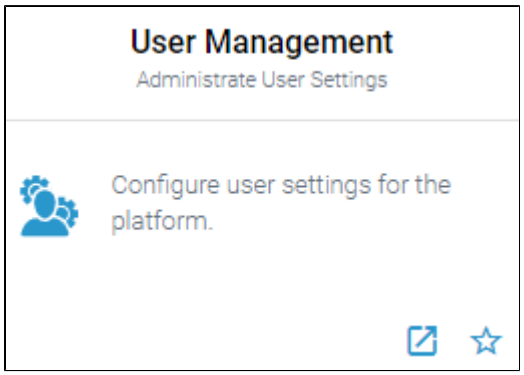
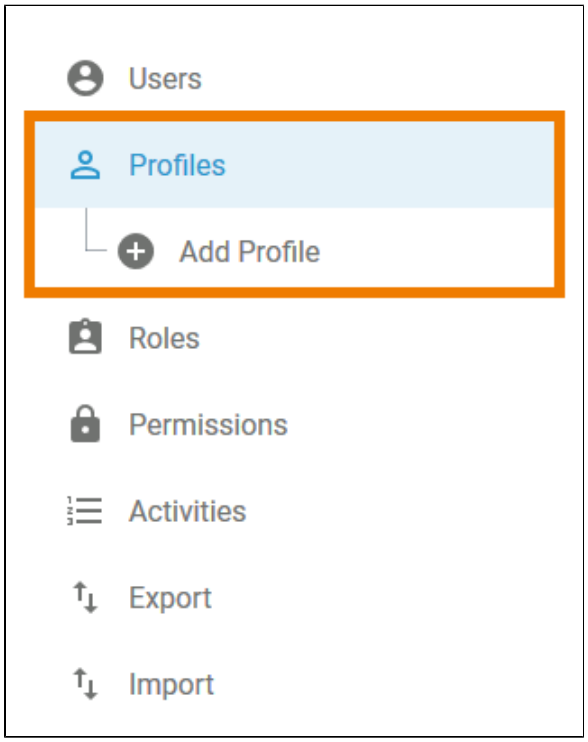
Creating a Namespace

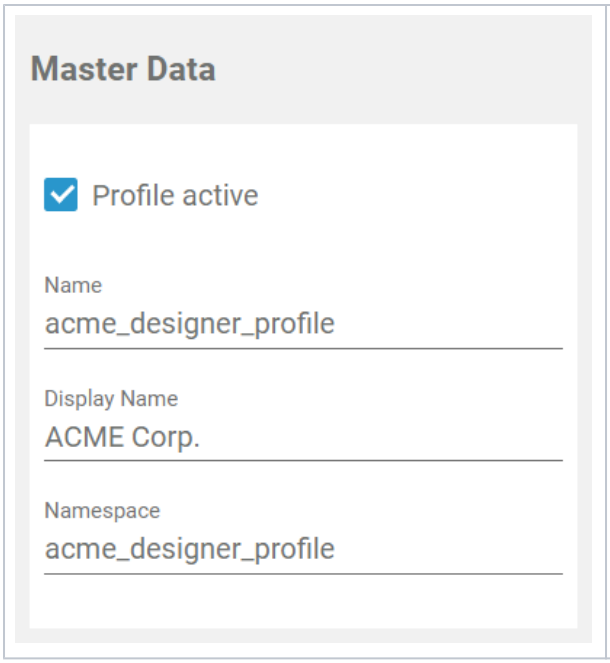


In **Scheer PAS** *User Management*, we are using profiles to grant the users the necessary permissions for the platform components. A Designer namespace is a special profile.



Namespace is the term for the memory location where the data of this profile is saved. In a profile without namespace, no data can be saved. You can not add or delete a namespace to/from an existing profile after creation.

If you want to create a (shared) namespace for the Designer, open the user management menu **Profiles** and click **Add Profile**.



An empty profile data sheet will open.

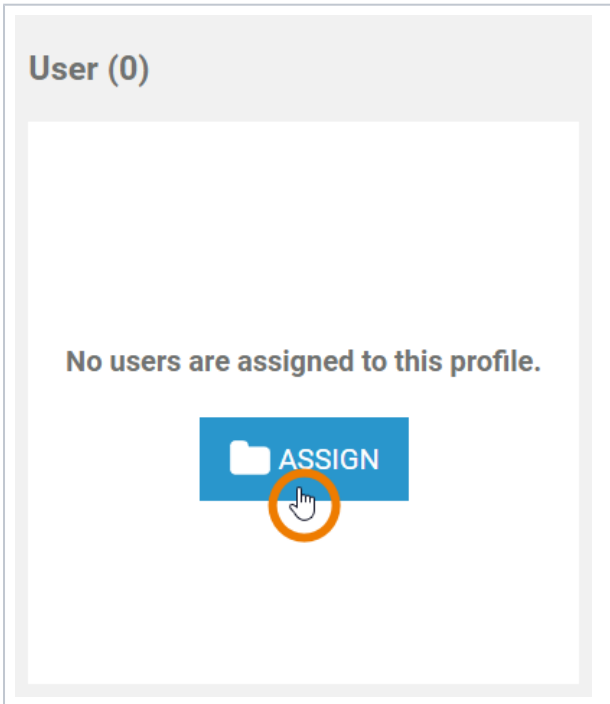
You can now enter a **Name**, a **Display Name** and a name for the **Namespace** of the new profile.

> Use the same identifier for **name** and **namespace** of a profile.

Click **Save** to create the profile /namespace.

For a detailed description see page Adding a Profile.

Assigning Users to a Namespace

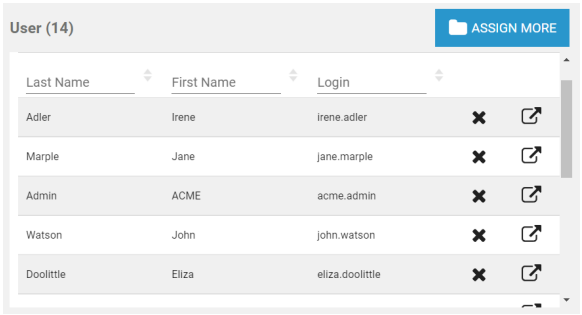


Once a namespace has been created, you can assign it to different users.

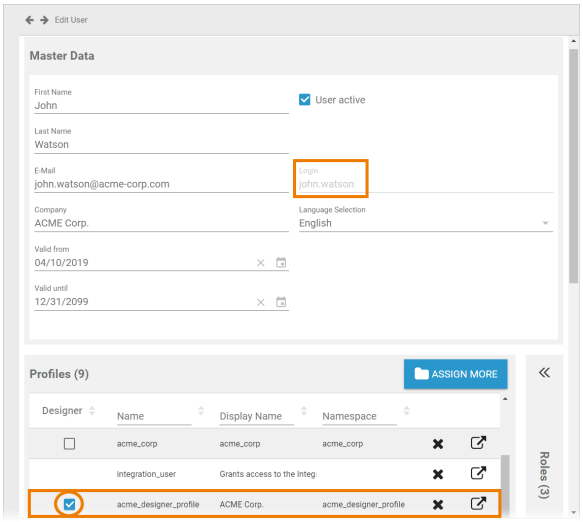
Open the profile's data sheet and scroll down to section **User**.

No users are yet assigned to a newly created profile. Click the **Assign** button to open the list of available users. Select the users you want to give access to the profile.

For a detailed description see Assigning Users on page Adding a Profile.

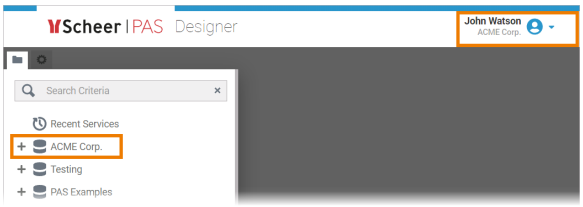


Your selection is transferred to the **User** section of the profile data sheet.



If you want to grant the user write permission, you have to switch to the user's data a

sheet and enable the corresponding checkbox in section **Profiles**.



Now all assigned users will see the namespace in the Explorer of **Scheer PAS** *Designer*.
