

# getServiceToken

Static operation.

This operation returns a new valid authorization token for the current service. It is the same as [getServiceAccountToken\(\)](#) but implemented as a static operation so that you do not need to create an instance of AuthService first. You can use this token to authenticate the caller when calling other services.

The returned token is service related, not user related.

## Parameters

Name	Type	Direction	Description	Allowed Values /Example
	String	return	Returns a valid token. The token is valid for a specific period of time.
