Deploying the Platform Services

⚠ If you are deploying the services for the first time (and not just updating them), do not check **St artup Service** to start the service after deployment. In this case, the service settings will still be missing on the **Scheer PAS** *BRIDGE* and you will have to adapt them to your configuration before starting the services (see Configuring the Platform Services).

Installing the Platform Services

1. **Unzip the release package.**
   Unzip file **dashboards-<version number>.zip**. This ZIP archive contains all necessary files to install the platform services.
2. **Install the platform services.**
   Open a browser window, go to your BRIDGE instance and deploy the Node.js repositories including

   - *admin-app_<version number>.zip*
   - *authenticator-service_<version number>.zip*
   - *file-storage_<version number>.zip*
   - *mailer-service_<version number>.zip*
   - *persistence-service_<version number>.zip*
   - *reporting-service_<version number>.zip*
   - *service-repository_<version number>.zip*
   - *user-service_<version number>.zip*
   - *userself-app_<version number>.zip*
   - *userself-service_<version number>.zip*

   If you need more information on how to deploy a service repository to a **Scheer PAS** *BRIDGE*, refer to the BRIDGE Documentation > Deployment of Node.js Services.

ⓘ Please note that prior to version 19.2 the services must be started in the following order:

   1. service-repository
   2. persistent-service
   3. file-storage
   4. reporting-service
   5. user-service
   6. mailer-service
   7. then all other services
