

Configuring an API

If you have created an API, you must configure it before you can publish the API to the API Developer Portal. Refer to [API Settings](#) for an overview of the available options in the API details view.

API Tab "Settings"

In tab **Settings** of the API details page you can provide the backend API implementation. You can configure the following options here:

- [Implementation](#)
- [API Type](#)
- [Visibility](#)
- [Plans and Approval Requirement](#)
- [Feature in API Developer Portal](#)

Defining the API Endpoint

Implementation

Unmanaged API Endpoint/Location *
https://acme.saas.pas-cloud.com/pas-test/gate

In section **Implementation**, you need to enter the URL that the API Management will use to proxy a request made for this API.

If you [import your API](#) from the PAS Administration, the API endpoint /location is automatically set.

Choosing the API Type

In API Management, you can create two different types of APIs: Public APIs and private APIs. Refer to [API Types: Public vs. Private](#) for a detailed overview on the differences between the two types. During API configuration, you should make a considered decision about the API type: It is not recommended to change the API type once the API has been published.

Depending on the chosen type, the content below the **Public API** toggle button changes (in addition, see [Defining the Visibility](#) and [Attaching Plans](#)):

On this Page:

By **default**, newly created or imported APIs are created as **private APIs**.

A private API cannot be consumed by everyone: They require an API Key in order to be called. To consume a private API, a client and a contract must be created. Compared to a public API, private APIs require more complex configuration.

 Public API

Public APIs do not require an API Key

Visibility

 Learn more about visibilities

Enable the toggle button to change the type to **public**.

A public API can be consumed by everyone (assuming no additional security policy has been set). It is also very easy to consume a public API: You just need to know its public endpoint. Clients do not need to register for a public API: Neither a client nor a contract are necessary. Compared to a private API, a public API requires less configuration.

Proceed with caution!

Changing this API to "public" requires no API Key for usage.

Confirm

Cancel

Proceed with caution!

Consumers of this API can only use this API version with an API Key.
You have to assign at least one plan to apply these changes.

Confirm

Cancel

If you change the type of the API, you must confirm your choice in a separate pop-up. Read the information carefully before you change the type.

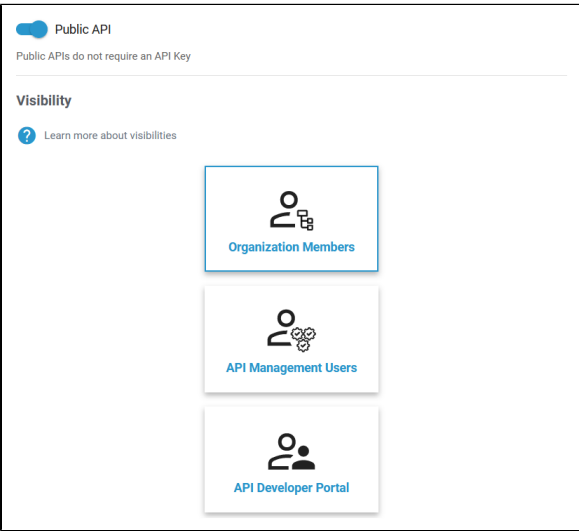

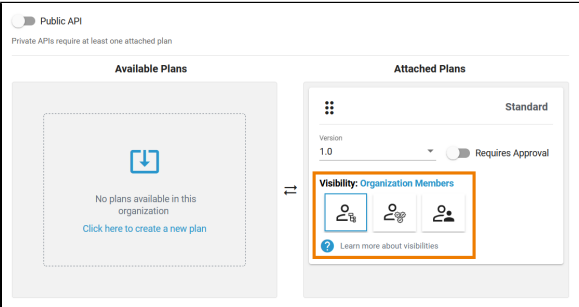

It is not recommended to change the API type once the API has been published.

Defining the Visibility

For detailed information about the visibility concept, refer to [The Concepts of API Management](#).

	<p>If you have enabled the option Public API, you can define the desired visibility for your API below.</p>
	<p>If you have chosen to make your API private, you need to attach at least one plan to section Attached Plans first. See Attaching Plans.</p> <p>The visibility is then defined for each plan separately.</p>

The handling is the same for both API types: Click on the option you want to apply.

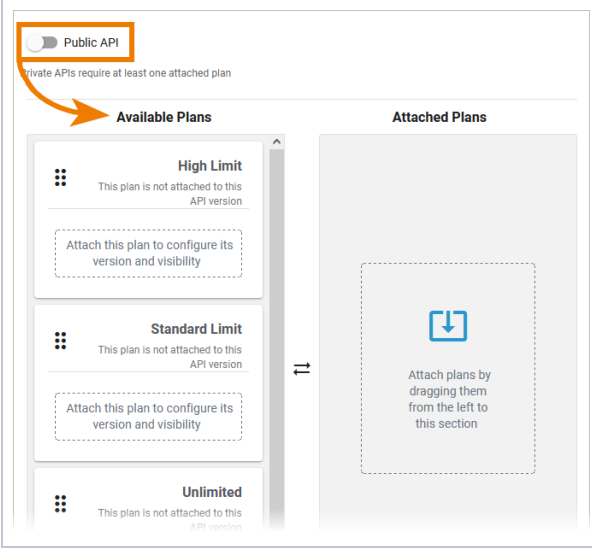

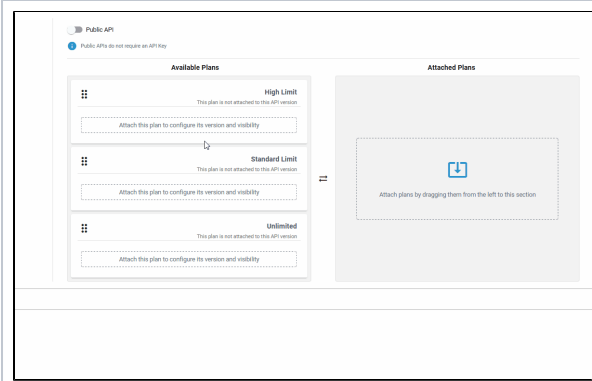

Visibility	Description
Organization Members (default)	<ul style="list-style-type: none"> All members of the organization. The PAS user must be listed in one of the Identity Management groups API-Management-Users, API-Management-Administrators or API-Management-Developer-Portal-Users.
API Management Users	<ul style="list-style-type: none"> Any PAS user listed in Identity Management groups API-Management-Users or API-Management-Administrators.

API Developer Portal Visitors	<ul style="list-style-type: none"> Any PAS user listed in Identity Management group API-Management-Developer-Portal-Users and any user who visits the API Developer Portal, whether logged in or not.
-------------------------------	---

In API Management, a user can see all APIs for which he has explicit permissions (roles **Viewer** and **Editor**). The permissions are assigned in the corresponding organizations, refer to [Admini strating Organization Members > Applicable Roles](#).
In addition, a user can be assigned the profile **api_management_admin** in the user management (refer to [Administration Guide](#)) which makes him a "superadmin" who can basically see and do everything in API Management (refer to [Administration](#) for details).

Attaching Plans

	<p>If option Public API is disabled, you need to attach at least one plan to the API.</p> <p>All plans that are available in the corresponding organization are displayed below.</p>
	<p>To attach a plan, drag them from section Available Plans to section Attached Plans.</p> <p>Once a plan is attached, you can configure the following options:</p>
<div>  <p>Click on the image to run through the animated version once. Click again to repeat.</p> </div>	

Option	Description
Version	Use the drop-down to select the version of the plan you want to use.
Requires Approval	Enable this option if a user should be able to use the plan only after granted approval.
Visibility	<p>Click one of the options to define the desired visibility for this plan. This affects the view in the API Management itself as well as in the API Developer Portal. See Defining the Visibility for an overview on the available visibility options.</p> <div>  For detailed information about the visibility concept, refer to The Concepts of API Management. </div>

<div> <div>API Developer Portal</div> <div> <div> <div></div> <div>Feature this API</div> </div> <div> <div>Featured APIs will be displayed on the landing page of the API Developer Portal</div> </div> </div> </div>	<p>In section API Developer Portal you can determine if you want to display the API on the landing page of the API Developer Portal. Enable option Feature this API to show this API directly on the portals's first page. This setting is valid for all versions of the API.</p>
--	---

API Tab "Documentation"

If the API is to be offered to a larger group of users, good documentation is helpful for further usage. An API definition file allows consumers to better understand how to use your API. If you want to test your API directly from API Management, it is necessary to have an API definition.

Adding API Definition

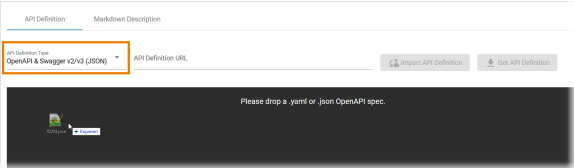

<div> <div>API Definition</div> <div>Markdown Description</div> </div> <div> <div>No API Definition</div> <div>API Definition URL</div> <div>OpenAPI & Swagger v2/v3 (JSON)</div> <div>OpenAPI & Swagger v2/v3 (YAML)</div> <div>WSDL</div> </div>	<p>API Management supports various types of definition files:</p> <ul style="list-style-type: none"> • OpenAPI & Swagger v2/v3 (JSON) • OpenAPI & Swagger v2/v3 (YAML) • WSDL
--	---

Open the drop-down list in field **API**

Definition
Type to select the type you want to use.

API definition files must be valid JSON or YAML files following the OpenAPI specification or valid WSDL files

	<p>cor di n g to th e W S D L s p e c i f i c a t i o n .</p>
 <p>The screenshot shows the 'API Definition' tab with a dropdown menu set to 'OpenAPI & Swagger v2/v3 (YAML)'. The 'API Definition URL' field contains the text 'https://acme-corp.com/definition' and is highlighted with an orange box. To the right is a blue button labeled 'Import API Definition' with a circular arrow icon.</p>	<p>If you want to load the API definition from a URL source, enter the URL in field API Definition URL and click Import API Definition to start the upload.</p>
 <p>The screenshot shows the 'API Definition' tab with a dropdown menu set to 'OpenAPI & Swagger v2/v3 (JSON)'. Below the 'API Definition URL' field are two buttons: 'Import API Definition' and 'Get API Definition'. A large dark grey area with a file icon and the text 'Please drop a .yaml or .json OpenAPI spec.' is shown, indicating a drag-and-drop editor.</p>	<p>To provide a JSON or YAML file, just drop it on the editor below.</p> <div><p> T h e e d i t o r a l l o w s y o u t o a d a p t t h e d i s p l a y e d e f</p></div>

changes.

API Definition	Markdown Description
<div> <div>API Definition Type</div> <div>WSDL</div> </div> <div>API Definition URL</div> <div> <div>Import API Definition</div> <div>Get API Definition</div> </div> <div>Enter your definition here...</div>	<p>A separate editor is available for definition type WSDL. Enter your definition manually.</p>

If you have imported the API from the PAS Administration, the API definition is populated automatically. Alternatively, you can load a definition from a URL, or add a definition manually:

Definition Options	Instructions
Adding a Definition Manually	<p>If no definition has been imported, you can add a definition manually:</p> <ol style="list-style-type: none"> 1. Select a definition type from the dropdown box. 2. Paste, or drag and drop the definition to the empty definition box.
Loading a Definition from a URL	<p>If no definition has been imported or if you need to update an existing definition, you can import a definition from a URL:</p> <ol style="list-style-type: none"> 1. Select a definition type from the dropdown box. 2. Add the URL to a Swagger or WSDL file containing the definition. 3. Click Import API Definition.
Updating a Definition	<p>If the definition of an imported API needs to be updated, you have to do this manually as there is no automatic re-import:</p> <ol style="list-style-type: none"> 1. Download the definition file from the source (e.g. from the integration component). 2. Replace the content of the definition box with the content of the downloaded file (manually or by using Import API Definition again).

 Adding or removing policies does not enrich the Open API documentation. You need to adjust your documentation manually. For more information on REST documentation and how to add documentation to xUML services, refer to [Bridge Guide > Documenting a REST Service](#).

API Tab "Policies"

A policy is a rule or a set of rules API Management uses to manage access to your APIs. Policies are applied to all API requests and represent a unit of work applied at runtime to the request by API Management. Policies are applied through a policy chain: when a request to an API is made, API Management creates a chain of policies to be applied to that request. The policy chain is applied to the request in a fixed order: Client policies are applied first, then policies added to plans, and finally policies added to the API itself (refer to [Policies > Policy Chain](#) for details).

 Refer to chapter [Policies](#) for an overview of the standard policies supplied with **Scheer PAS API Management**. Page [Attaching Policies](#) explains how to attach and configure a policy.
