

# Platform Services

The PAS platform offers a range of platform services that you can use via its REST interfaces or via a library from the asset repository in the Designer (referer to [Adding Assets](#) in the [Designer Guide](#)). You can use the various platform services to access platform functionality, e.g. users or files.

For some of the services, the configuration can or must be adapted to the corresponding environment. The possible configuration options for these services are explained in this chapter:
