

Templates

Templates make the creation of an analysis easier because the basic settings such as chart type or underlying process have already been preconfigured. A user-friendly wizard guides you through the few steps required to create a template. Use the sidebar to create and manage Process Mining templates.

Two basic types of templates are available:

System Templates	
 	System templates can be used by all users, but can only be created and edited by an administrator. Four system templates are included as standard: Process duration: Shows the average daily process duration in a line chart. Start event: Shows the daily distribution the processes to start events in a bar chart. End Event: Shows the average daily process time in a line chart. Function throughout time: Shows the average daily function duration in a line chart.
User-defined Templates	
 	Every user is allowed to create user-defined templates. A user-defined template can only be used and edited by the user who created it. Administrators are allowed to edit all custom templates.

When you open the [Templates Sidebar](#) for the first time, the four standard [system templates](#) are displayed on the desktop:

System [templates](#) can be used directly when creating an analysis (refer to [Using a Template](#)). If you want to create a new template, use option **Create New Template** in the sidebar. Users can edit custom templates later. It is also possible to duplicate a template.
