# xUML Service Standard Log

By default, the **bridgeserver** logging information of the current day will be displayed. There is one log file per day.
The amount of data that is logged depends on the selected log level (see Error Log Levels). Additional trace information is logged, if the service was called via the E2E Analyzer with enabled trace.

How to search the logfiles is explained in detail on Logging of xUML Services.

> The log files are very useful for debugging. If a problem with an xUML service occurs, check its Bridge log for errors. Each incident will be recorded in chronological order.

The following information is displayed in the xUML service standard log:

Date/Time	Session ID	Log Level	Category	Error Domain	Error Code	Description
2014-05-26 10:41:42 +0200	0000000000	Info	Internal	SOAPADLM	42	Tracing is not allowed.
