

getServiceAccountToken

Non-static operation.

This operation returns a new valid authorization token for the current service. You need a current authenticator service object to call this operation (which you can get using [getAuthService\(\)](#)).

You can use this token to authenticate the caller when calling other services.

The returned token is service related, not user related.

Parameters

Name	Type	Direction	Description	Allowed Values /Example
	String	return	Returns a new service token as provided by the authenticator service.
