

The Element Software Robot

The Element Software Robot

BPaaS 17.4

E l e m e n t	 <div>Software Robot</div> <div>Software Robot</div>
F u n c t i o n	<p>The EPC element Software Robot is used to integrate a virtual worker into the business process. The Software Robot is able to execute tasks automatically. Analog to a natural person the robot has to be allocated its own BPaaS user and the necessary authorizations.</p> <p>A Software Robot is modeled in UiPath Studio. During the modelling, it is determined what exactly the robot does and which applications such as Excel, Word, PowerPoint or SAP it uses.</p> <div> For Software Robot creation we collaborate with our partner UiPath.</div>
C o n n e c t i o n	<p>Predecessor: None</p> <p>Successor: Function</p>
E x a m p l e	<p>A user received several business cards at a trade fair. Now he wants to add these contacts to his Outlook account. Instead of typing the data himself, he uses an app including a software robot. The user takes a picture of each business card in form Address aquisition. The Software Robot Outlook data uses the pictures to extract the data and creates automatically new data sheets for every contact in Outlook. The data is also sent to BPaaS, so the user can open form Address Data to display the data of his new contacts and use them in other apps.</p> 

 The Element **Software Robot** is only activated for **Scheer PAS RPA** licensed clients.

Configuration Options

Edit the element via the **Edit Sidebar**.

EDIT ARGUMENTS

Edit Arguments

Clicking the **Edit Arguments** button opens another editor to configure robot arguments.

Robot arguments are values the robot gets from BPaaS at startup.

The editor is explained in detail on page [Robot Arguments](#).
