

Worker

The Element Worker

E l e m e n t	
F u n c t i o n	<p>The EPK element Worker offers advanced users the possibility to program functionalities in JavaScript in order to extend the app with their own scripting. Worker can be easily exchanged, added, moved or removed. A Worker can be executed from client side or from server side. Workers are mainly used to execute server-side functionalities.</p> <p>A worker can be used for example for the automated generation of IDs. Other use cases are desired changes to the user interface such as the display and hiding of fields or manipulation of data in the container.</p>
C o n n e c t i o n	<p>Predecessor: None Successor: Function</p>
E x a m p l e	<p>During the ACME Bidding Proces users shall be informed of the successful dispatch of their <i>Propo</i>sal Mail. The Worker Alert Proposal Sent contains therefore a JavaScript coding triggering a pop-up window with corresponding confirmation information to appear post dispatch.</p>

Many functionalities as for example default settings for form fields can be customized via the [form functions](#) **Before Form Execution**, **After Show Form** or **After Form Execution** and do not require the use of a worker. Workers should mainly be used for more complex applications.
